

AME-2kN in auto parts production lines

The AME model testing machine is a solution for repetitive testings in auto parts production lines. The image below* shows an AME-2kN adapted for a production line running full time. Among the important features of an AME testing machine are relays to secure the part under test in place and automatic generation and saving of each testing report.

The choice of an AME testing machine grants customers access to a compact and reliable testing platform, at a possibly lower cost than that of an in-house solution. Let us know the testing needs of your production line, we will be glad to propose solutions.

* pneumatics and bench adapted by customer.
