

### DynaView Software as a retrofit for electromechanical testing machine

The application of DynaView software as a retrofit for hydraulic testing machines is common. It is however also possible to use it to update electromechanical testing machines in certain cases. The image below shows an old testing machine with chart recorder, in which the extensometer was replaced by an AEX model and the load cell kept without change. Connected to DynaView software, allow to make testings with modern features, with calculation in many parameters and HTML report generation, remaining only the crosshead motion manually activated.

This case of maintenance, made with minimal changes to the machine, shows one more possibility of application of DynaView software with competitive cost. Let us know the need for testing machines update in your company, we will be glad to propose solutions.
